---

Dear

Brent Turner and  
Shane Burgos

I write as the 2nd author of the Voting theory paper referenced bellow..

Please post a link to this paper:

<http://www.votingmatters.org.uk/ISSUE27/I27P1.pdf> on  
your [New Voting System RFI web page](#)

and thus provided is as topic for discussion regarding the use of information  
theoretically optimal ranked choice preferential vote tallying methods...

I request that a panel of well credentialed mathematicians should be appointed to  
effectively evaluate, potential preferential ranked vote tallying methods. and provide an  
appropriate recommendation.

I remain available for consultation (at no cost), then as it is our work in the field of  
ranked choice voting preferential theory, that I am requesting be considered.. others,  
well respected should offer there own evaluation.

Let me suggest that you might contact Keith Devlin:

(NPR's math guy)..

see: <http://web.stanford.edu/~kdevlin/> as possibly able to assist in helping to assemble  
a panel of experts.. for such a recommendation.

Sincerely your's

-Peter Lindener
